

Lynx Photofinish System

The results spreadsheet can be used to generate a file named Lynx.evt which can be used with the Lynx Photofinish system to set up all the scoring events for the match. The three spreadsheets are

SALResultsphotofinish.xls – for Divisions 1 and 2

SALResultsd3swphotofinish.xls – for Division 3SW (5 teams per match)

SALResultsd3nephotofinish.xls – for Division 3 NE (5 or 6 teams per match)

After inputting all the team declarations, click on the rightmost worksheet, labelled photo. You should see the track events in running order sequence, with the declared names inserted.

To create the event file click on the “photo” worksheet and “save as” .csv (MS-DOS). This comma separated values (csv) file should be saved to the same place as the results spreadsheet, with the same name, but with the .csv extension. Now open this saved .csv file in notepad and “save as” lynx.evt under “all files” to create the required file for Lynx. This should now be transferred to the computer controlling the Lynx photofinish system.
